

IRRI-GRIMS: Tool for managing the largest rice collection

Ella Herrera

TT Chang Genetic Resources Center, IRRI

2007 ICIS Developers' Workshop , SPARC, Canada

- 
- ❖ Overview of IRRI-GRIMS
 - ❖ Features
 - ❖ Mapping of Genebank concepts/ objects to ICIS
 - ❖ Advantages of Adopting ICIS Technology
 - ❖ Current Activities

Overview

❖ IRRI Genetic Resources Information Management System

- A data management tool for IRRI genebank that uses ICIS tools and application
 - An overhaul of legacy system (International Rice Genebank Information System/ IRGCIS)
 - Uses GMS, DMS, IMS and GRIMS-specific schema
 - Deployed at IRRI Genebank in January 2007
- Developing GRIMS required migration of both program codes and data to new programming language and database schema

Features

- ❖ Incoming germplasm receipt and registration
- ❖ Seed selection for regeneration and characterization
- ❖ Seed distribution and seed request tracking (within genebank)
- ❖ Seed viability monitoring
- ❖ Automated inventory management using barcode technology and digital weighing scale
- ❖ Integration with other organizational unit's data within IRRI (i.e. Seed Health, Plant Breeding, and INGER)

Mapping of Genebank concepts to ICIS

- **Incoming samples**
- Germplasm acquisition method -> Imported

- Imported
 - Germplasm date (GDATE) is the acquisition date
 - Germplasm location is the holding institute -> TT Chang Genetic Resources Center (IRRI)

- Creation of germplasm group and source for collected samples
 - Create a germplasm and attach all the collecting information to it
 - Set this germplasm as the group and source of the sample received by the genebank

Mapping of Genebank Concepts to ICIS

➤ Accession

- Identified through Management Group ID (MGID)
- Start of management neighborhood where GID=MGID
- Holding institute as the germplasm location

➤ Passport Data

- Descriptive passport data are stored as germplasm ATTRIBUTES
- Phenotypic passport data are stored in DMS
 - One study corresponds to one planting season
 - A single accession can have multiple characterization data due to multiple field trials
- * *Publicly available*

Mapping of Genebank Concepts to ICIS

❖ Names

- Management name
 - Seed increase/ regeneration name
- Donor accession number
 - IRRI received an accession from other genebank
- Foreign accession number
 - IRRI donated accession to other genebank

Mapping of Genbank Concepts to ICIS

- ❖ *What should be the name state/ status of local names in their original form -or- of UNICODE names?*
 - NSTAT - Number indicating the storage type and status of the name
 - 1 – Preferred name (must be ASCII) → ***Can we allow unicode names as the preferred one?***
 - ***i.e. Lao script, cultivars with no English names***
 - 10 - UNICODE names which are not preferred
 - Temporarily being used

Mapping of Genebank Concepts to ICIS

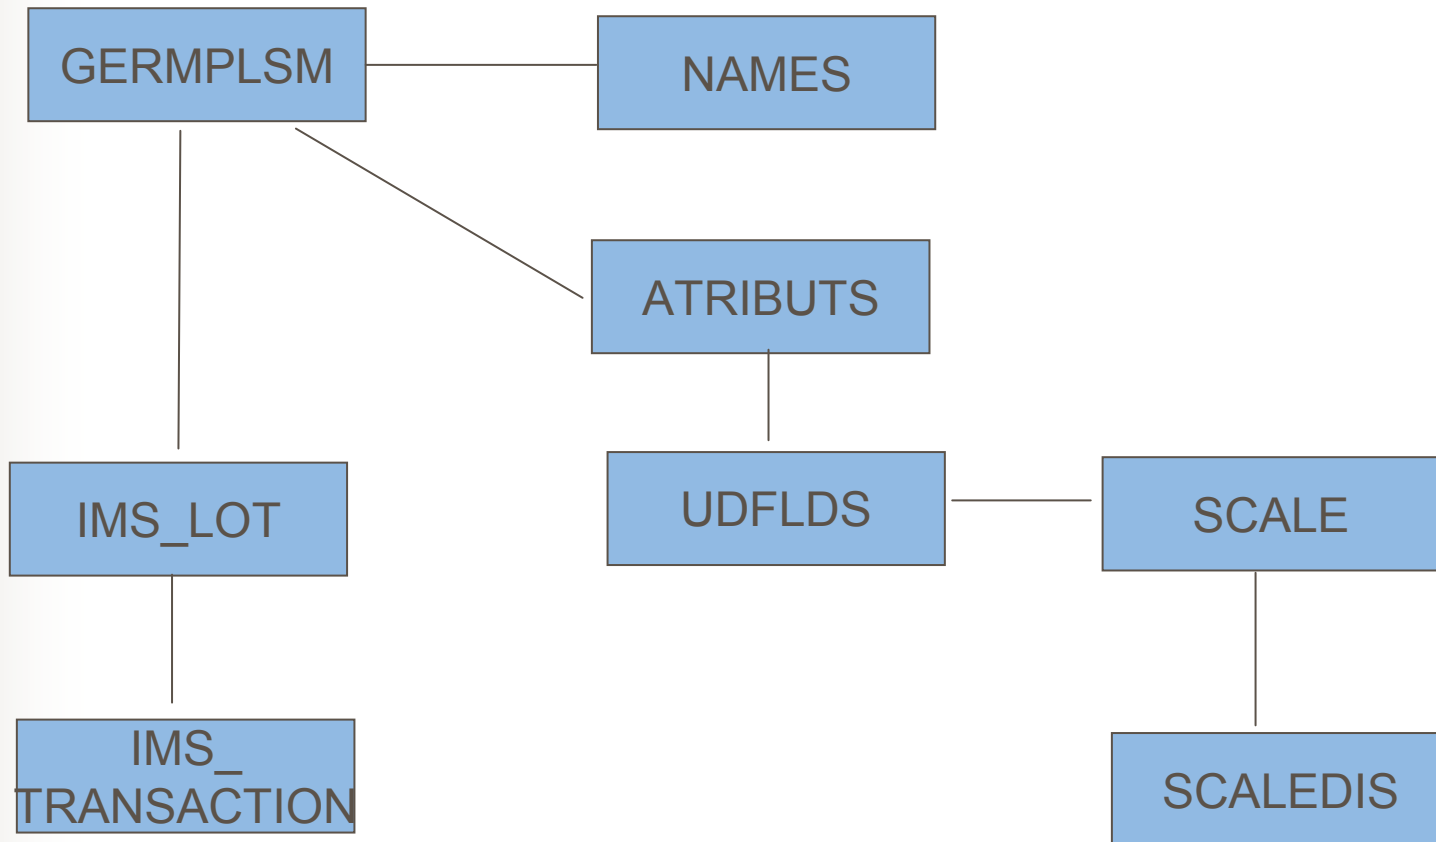

❖ Seed inventory data

- Seed lot information and transaction data are stored in ICIS IMS_LOT and IMS_TRANSACTION tables

❖ Distribution data

- Request details such as the requestor information, plot details, origin, MTA status, etc are stored in DMS

Relationship Diagram: Names, Passport, Inventory

Advantages of Adopting ICIS Technology

- ❖ Genebank data integration to other institutional databases
 - Link to germplasm from other locations
 - Better use of essential information
- ❖ Easy access to germplasm generation information
 - Management of genetic identity
 - Tracking of germplasm history
- ❖ Open access to genebank data through development of web interface/ search engine

Genebank Needs

- ❖ Development of web interface for more effective data sharing and exchanging

Web interface that :

- Searches for passport and phenotypic data
- Has an option to query only the studies that came from Genebank
 - Create a STUDY TYPE that corresponds to genebank characterization data (?)
- Handles seed request

Current Web Search

Passport data - Characteristics of collection site

Morpho-agronomic data

- | | |
|--|--|
| <input type="checkbox"/> Anther length (mm) - wild | <input type="checkbox"/> Ligule pubescence - wild |
| <input type="checkbox"/> Apiculus color at post-harvest | <input type="checkbox"/> Ligule shape |
| <input type="checkbox"/> Apiculus color at reproductive | <input type="checkbox"/> 2nd leaf length (cm) - wild |
| <input type="checkbox"/> Auricle color at vegetative | <input type="checkbox"/> Leaf length - cultivated |
| <input type="checkbox"/> Awn color | <input type="checkbox"/> Lemma and palea color at anthesis - wild |
| <input type="checkbox"/> Awn length (mm) at anthesis - wild | <input type="checkbox"/> Lemma and palea color at post-harvest |
| <input type="checkbox"/> Awn presence at reproductive | <input type="checkbox"/> Lemma and palea pubescence |
| <input type="checkbox"/> Blade color at vegetative | <input type="checkbox"/> Leaf senescence |
| <input type="checkbox"/> Blade pubescence at vegetative | <input type="checkbox"/> Leaf texture at 75 DAG - wild |
| <input type="checkbox"/> Basal leafsheath color at vegetative | <input type="checkbox"/> 2nd leaf width (cm) - wild |
| <input type="checkbox"/> Collar color at vegetative - cultivated | <input type="checkbox"/> Leaf width - cultivated |
| <input type="checkbox"/> Chromosome number - wild | <input type="checkbox"/> 2nd leaf ligule length (mm) at 7 DAA - wild |

| <input type="checkbox"/> Culm length at reproductive | <input type="checkbox"/> Panicle axis at reproductive |
| <input type="checkbox"/> Culm number (code) at reproductive - cultivated | <input type="checkbox"/> Texture of panicle axis at 7 DAA - wild |
| <input type="checkbox"/> Culm strength at harvest - wild | <input type="checkbox"/> Panicle exertion at reproductive |
| <input type="checkbox"/> Culm strength at reproductive - cultivated | <input type="checkbox"/> Panicle length at post-harvest |
| <input type="checkbox"/> Date at first flowering | <input type="checkbox"/> Panicle length at reproductive - wild |
| <input type="checkbox"/> Date of seeding | <input type="checkbox"/> Population composition - african cultivated |
| <input type="checkbox"/> Distance (mm) panicle to spikelet at 7 DAA - wild | <input type="checkbox"/> Panicle shattering |
| <input type="checkbox"/> Endosperm type | <input type="checkbox"/> Panicle threshability |
| <input type="checkbox"/> Flag leaf angle at 7 DAA - wild | <input type="checkbox"/> Panicle type |
| <input type="checkbox"/> Flag leaf angle at reproductive - cultivated | <input type="checkbox"/> Rhizome/stolon formation - wild |
| <input type="checkbox"/> Grain length (mm) | <input type="checkbox"/> Seed coat color |
| <input type="checkbox"/> Grain thickness (mm) - wild | <input type="checkbox"/> Scent - cultivated |

STEP 2 - Select conditions

Germplasm name list

Pls. limit your entries to 1000!

Accession list

Pls. limit your entries to 1000!

Specify conditions

Passport data- Basic

 Acquisition date Donor Source country Seed Source (country) Seed Source (station) Previous designation Sender's Firstname Sender's Lastname Species Scientific name Classification of *O. sativa* samples Variety name

Passport data - Collecting team

 Collecting institute Collector(s) Firstname Collector(s) Lastname Collection number Funding agency

STEP 3 - Specify conditions

Rules for specifying conditions

1. Your condition must be of the form **<OPERATOR> <VALUE>**.
2. Default OPERATOR is = when omitted.
3. Valid OPERATOR are:
{ = , > , < , >= , <= , LIKE , IN , BETWEEN }
 - a. Format for IN : **IN (<VAL1>,<VAL2>,...)**
 - b. Format for BETWEEN : **BETWEEN <VAL1> AND <VAL2>**
4. VALUE should NOT be enclosed in quotes.
5. [Click here](#) to view expected VALUES for each descriptors.

Example:

Variety name	=MALAGKIT
Apiculus color at post-harvest	020
Apiculus color at reproductive	052
Auricle color at vegetative	000
Grain length (mm)	> 5
Grain thickness (mm) - wild	<=6
Grain width (mm)	<7

Maturity - cultivated

Seed coat color

Next step

Genebank Needs

- ❖ ICIS module that handles germination result/
viability data
 - Viability and seed inventory data always go together
(i.e. selection of planting material for regeneration
and distribution)
 - Should it be a variate?
 - Another object in IMS?
 - Or a field in IMS_LOT?

Other Genebank Concepts not yet in ICIS

❖ Taxonomy

- Status: Uses SCALEDIS

❖ Mission

- Status: Stored as an attribute value
 - Funding agency, country, start date, end data

Current Activities

- ❖ Test and implement full migration of GRIMS backend database from Oracle to PostgreSQL
- ❖ Use of hand-held device for field trials
- ❖ Improve the data quality of genebank data in IRIS especially for the germplasm group and source information
- ❖ Integration of documents and images to IRIS
- ❖ Integration of Herbarium Database to IRIS
 - Inherits MGID's passport data
